

HaulMark Enterprise

The Enterprise version of the HaulMark product manages the information for operations with multiple lines of business in the hauling arena. Information is collected from a combination of any or all of the common lines of business such as Roll off, Commercial Front End and Residential. It is then intelligently categorized and distributed based on your desired organizational structure.

Information can be configured to be kept separate when needed and consolidated where appropriate.

The idea is to consolidate the information that should be consolidated and separate the information that should be separated. You can tailor HaulMark so users only see and work with the aspects of the system that they need to do their job.

HaulMark Enterprise is designed around job functions, not information. It is set up to allow users to be able to do their job entirely within the area of HaulMark™ that pertains to their job description.

Roll Off Dispatching, Residential Routing, Negotiating and setting up customer service agreements and billing are all separate areas of responsibility. Each has its distinct area of navigation, organization and security within HaulMark Enterprise.

Intelligent Integration

Maintain ease of use and organize complex waste industry business rules intelligently ...

Team Coordination

Customer information is consolidated and kept separate where needed. The name and address information can be entered once and the line of business relationship is defined specifically to the type of service provided. A customer can have specific roll off contracts as well as front end or residential contracts.

Each line of business can be billed separately or together and differently on a customer-by-customer basis. For example, your front end operations personnel are maintaining the front end information while the roll off people are managing the roll off information.

Insight Environmental Software

HaulMark Enterprise

You may configure your billing and accounts receivable to be managed centrally while the front end operations of dispatching and routing are managed separately.

Information is maintained centrally and can be analyzed consolidated, by each operating line, or both.

Information can be synchronized and centralized in cases where your operation spans multiple physical locations.

HaulMark Enterprise helps you collect, separate and organize your information so you see the answers to your management questions.

- Integrated Customer Management, Billing and Accounting across all lines of business
- Coordination of information between roll off dispatching, commercial front end and residential
- Centralized billing, reporting and analysis. Consolidated reporting with the options to drill down to the performance of each line of business

HaulMark™ Enterprise achieves the delicate blend of simplicity of use with the management of complex business rules and sophisticated reporting by organizing the information effectively and organizing the tools the way you do your work.

Reporting and analysis of your business requires the thorough scrutiny of each line of business and the components of that line of business. How is the roll off operation doing compared to the front end operation? Within the roll off, how do we do relative to each type of container? Or which types of customers do we do well with?

Analyze the business by routes, route types and drivers. Each line of business has its own unique questions that need answers from integrated information. HaulMark Enterprise helps you collect, separate and organize your information so you see the answers to your management questions.
